## **ABSTRACT**

A system and method for implementing an emergency response system is provided, wherein a package is sold to an end user, access to a cellular communications network is provided to the user, and at least a portion of the collected revenue is used to fund a safety control center that receives emergency signals conveyed from the location of the end user through an emergency network. The safety control center contacts an emergency entity in response to the emergency signal to provide emergency services. Another portion of the collected revenue may be used to fund a carrier associated with the cellular communications network.
